Geometric cues for directing the differentiation of mesenchymal stem cells Article (PDF Available) in Proceedings of the National Academy of Sciences 107(11):4872-7 · March 2010 with 112 Reads

**(PDF) Geometric cues for directing the differentiation of**

8 geometric differentiation Differentiation is the process of computing with changes in quantities. When the changes are small, those computations can be linear to a good approximation, and it is not too hard to develop a calculus for geometry by analogy to classical analysis.

**Geometric Differentiation For The Intelligence Of Curves**

Directing MSC Differentiation with Geometric Cues. We first identified the appropriate size of a patterned feature that would show little bias in directing cell differentiation towards osteogenic and adipogenic fates. Cells that were adherent to mixed shapes with a range of geometric features and having areas of 1,000, 2,500 and, 5,000  $\mu\text{m}^2$  were treated with mixed media for one week and then ...

Geometric Interpretation of Differentiation Tangent line Secant line  $f(x) = P(x) + Q(x)$  Figure 1: A graph with secant and tangent lines. The derivative of  $f(x)$  at  $x = x_0$  is the slope of the tangent line to the graph of  $f(x)$  at the point  $(x_0, f(x_0))$ . But what is a tangent line? It is NOT just a line that meets the graph at one point.

**y Q Secant line P Tangent line  $f(x)$  - MIT OpenCourseWare**

Introduction to the geometric distribution. Consider a sequence of trials, where each trial has only two possible outcomes (designated failure and success).

Differential geometry is closely related to differential topology and the geometric aspects of the theory of differential equations. The differential geometry of surfaces captures many of the key ideas and techniques endemic to this field.
